

Choosing the correct adhesive

Stauf produces a complete line of [wood flooring adhesive](#) products. They include adhesives having bases common in the industry (water, urethane) and two unique adhesives, one that uses a highly desired reformulated alcohol base and the other which uses the newest, "5th Generation" of adhesive ingredients - polymers.

There is a Stauf adhesive available for every floor and every wood flooring product. Every Stauf Adhesive is certified "green" by the European environmental agency GEV, with the exception of Solva-Mastic WFR-930. It has an alcohol base, but does not contain or emit ozone depleting ingredients. It is VOC compliant.

Stauf also offers a line of [sub floor preparation](#) materials, such as leveling compounds, concrete crack fillers and underlayments.

Stauf produces a complete line of [Primers](#) for preparing sub floors to grab adhesives more strongly. They include water, alcohol and urethane based primer products to match those adhesive types.

Stauf also produces two [Sealer](#) products which are guaranteed to reduce sub floor moisture contents to 3#, even when the moisture content measured in the slab is 8# and up to 18#. Neither product contains any water, solvents or VOC's.

Besides other [tools](#) for installation, Stauf Notched Trowels serve as the perfect measuring devices to ensure the spread rate is accurate. Stauf has a complete line for parquet, solid and engineered floors, as well as a unique trowel for use with SMP-960 One-Step Adhesive. A special 22" wide trowel is also available for spreading ACS-210 Sealer.

Stauf also has floor [cleaning](#) and preparation products to meet most flooring needs. They include concrete leveling compounds, crack fillers, and floor patch, as well as floor cleaners for urethane, alcohol and other adhesives.
